

Aluminium strips

Descripción

Rolled strips of aluminium.

Also known as aluminium strips.

Aluminium has a combination of properties that make it very useful in mechanical engineering, such as its low density (2,700 kg/m³) and its high corrosion resistance.

Making it into the right alloys can considerably increase its mechanical resistance.

Among its characteristics, it stands out due to it being:

- A good conductor of electricity and heat,
- And for its machining capacity.
